

Minimizers

Using windows and minimizers

Rather than using a stride w , use a window w

Within the window, have an order (function) which picks a single kmer in that window

In this manner, we have:

window w ; kmer size k ; order o

Window:

Minimizer: Select the **minimum kmer** from a **window** according to an **order**

Window	Selected kmer (minimizer)
GATCGTACAGTCAGTC	ACAGT
